QUESTION: The bid states to have FP analyzed for VOC's and PAH's. The lab said they can do this, but need to dilute it quite a bit. Is this what you are looking for? Or is it something else.

Answer: The intent is to have the free product analyzed for PVOC's and PAH's in an attempt to determine what type of product it is (gasoline or diesel). Dilution is acceptable as long as the results are corrected to reflect dilution.
